

Prescription drug use now causing more driving fatalities than alcohol

According to a study published in the *Public Health Reports*, driving under the influence of prescription drugs is becoming a large problem in society, causing more fatal driving accidents than ever before.

Today, driving fatalities due to driving under the influence of prescription drugs, including Xanax, Cymbalta, Zoloft, Wellbutrin, Lexapro, Sarafem and Abilify, are surpassing those caused by drunk drivers.

"While we've seen a decrease over the years in motor vehicle fatalities involving people under the influence [of alcohol], the nature of those crashes is changing," said study author Fernando Wilson, Ph.D., associate professor at the University of Nebraska Medical Center.
